Reference 1 - 3.98% Coverage

Traditionally, that looked like television stations, magazines and newspapers. While Chayka acknowledged that had its own problems, having algorithms as new gatekeepers also had issues. "It only judges based on data ... it has no feelings, it has no creativity, it has no human soul."

Reference 1 - 7.69% Coverage

The flamingo picture was a symbol of the natural world and human creativity, he said.
"In an increasingly digital world, where we do everything online, where we work online, date online, shop online, socialise online, I think this speaks to a place where we're rooted in nature, and I think that's a beautiful thing. And I think that's not going to go away and the machine cannot replace that."

And there are even bigger questions to ponder, ones she feels have been pinpointed by Australian musician Nick Cave.
â€œCan you really replicate human emotions? What does it mean to be human, really?â€ she says.
â€œNot long after its public release, ChatGPT was asked to write a song in the style of Nick Cave. It went viral.
â€œCave, after studying the lyrics, came out and said that ChatGPT was the commodification of the human spirit and â€˜a grotesque mockery of what it is to be humanâ€™.
â€œ

<Files\\Processed x Highly relevant\\2024-07-08 - SPN - Fake news, AI slop and little> - § 3 references coded [7.64% Coverage]

Reference 1 - 1.08% Coverage

Controlled by an algorithm that is utterly opaque and dominated by either advertising or content the algorithm deems engaging, the number of recommended posts in your newsfeed (posts from pages, groups or people you don't follow) has doubled since 2022. According to the researchers, Facebook is also actively recommending AI content, or slop, into users' feeds.
W

Reference 2 - 0.54% Coverage

My newsfeed these days largely consists of three things: posts from the groups I'm in, ads, and now, the plague-like sprawl of fake posts, bot-farmed engagement and meaningless imagery.

Reference 3 - 6.02% Coverage

Meta has done exactly that in Canada and may follow suit in Australia, where similar legislation exists. It makes you wonder what, of any quality or utility, will be left in our newsfeeds if friends, family, and news are largely gone, and AI slop and fake news continue to proliferate.
Everyone's Facebook newsfeed is different — there is no singular Facebook; instead, there are billions of algorithmically determined Facebooks. Maybe yours is fine, maybe you still see news and friends and family, and your feed looks like mine did in 2014, just with twice the number of posts you didn't ask for. My algorithm is undoubtedly borked by my sick professional interest in the weirder aspects of the platform.
Despite that granularity of experience, there is a growing consensus that Facebook is something of a wasteland, a beast that has grown billions of limbs that, at various points, have turned gangrenous, dropped off, and now haphazardly fly around hitting you in the face when you visit. As 404 Media's Jason Koebler told The Guardian recently, the proliferation of AI "art" is representative of the "zombie internet" where Facebook is now "a mix of bots, humans and accounts that were once humans but aren't any more mix together to form a disastrous website where there is little social connection at all." The scale of junk cluttering the place seems like it can't be thwarted or reigned in and is now beyond cleaning up, control or regulation.
I used to worry about what would happen to my social media profiles when I died. I didn't want them hacked or taken over, freaking out those left behind. I don't worry about that happening with my Facebook profile anymore. A hacked AI me posting from beyond the grave seems kinda chill compared to the things I've seen.
Who knows who will be dead, according to Facebook, next week? At least we can take comfort in knowing someone will make a trailer for a third Barbie movie, and an army of AI-generated soft-porn soldiers stand at the ready to shepherd the nation through its mourning.

â€œThe emergence of new forms of generative AI technology has been striking, perhaps most of all because it appears that many of the recent tools have been able to demonstrate rapid advances in higher-skill and creative tasks that were previously imagined to be harder to replicate, and so thought to be uniquely â€˜humanâ€™.
