Again, governance issues come into play â€" which again feeds into one of Grayâ€™s central themes.
â€œClassification is one of the most important areas to start because weâ€™re seeing a lot of organisations that havenâ€™t done the classification.
â€œWhen you start pointing artificial intelligence at your data, if it doesnâ€™t know what information should be served up to who, you start to have risk of privacy issues.â€

Reference 1 - 1.22% Coverage

Examples included leaking of personal information in AI outputs, impersonation and fraud, nonconsensual fake images, audio and video, and automated decisions based on incorrect information or biased processing.

<Files\\Processed x Highly relevant\\2024-07-03 - RNZ - Experts cautiously optimistic> - § 2 references coded [4.47% Coverage]

Reference 1 - 2.08% Coverage

However, a broader concern was how personal information would be used.
"Data powers these AI systems, it's what allows them to continue to improve, it's what lets you build them in the first place. So any and all data that these AI producers can get, if they can they will likely want to feed it back into their systems," he said.

Reference 2 - 2.39% Coverage

"There are ways of using these systems that are relatively safe in terms of the data - you can run local versions of the AI, you can make sure that the data is not being used for fine-tuning in various ways. So it's not an insurmountable problem, but it is a problem that has to be confronted directly and accounted for when you're designing how you're going to use these things."

They warn organisations need to urgently school up on the privacy risks in using this technology now.

Reference 2 - 1.45% Coverage

He said it could result in more casual work meetings being recorded, and vast screeds of personal and sensitive information being stored in the AI tool.

Reference 3 - 2.85% Coverage

"You have to provide them with the audio, and you might not have control over what happens to that audio afterwards. Once they've transcribed it, they're going to keep a record of that text, you might not have much control over what happens to that text. It's all buried in the terms and conditions."

Reference 4 - 6.28% Coverage

Privacy Commissioner Michael Webster said workplaces must be aware of data leaking - and that was critical where sensitive information - like health information - was being discussed.
He gave the example of a construction worker revealing feelings of depression to their boss in a meeting being recorded and transcribed by AI.
"Our bottom line is don't input into a generative AI tool personal, confidential information unless you're absolutely sure that input information is not going to be retained or disclosed by the AI tool."
Webster said while this technology is rapidly developing, organisations must do a full privacy assessment before they use it.

Reference 5 - 2.47% Coverage

"The key issue for me - from a privacy perspective - is that people are aware of what's being done with their personal information, where it's being stored, whether it's being stored securely, and whether it's being protected from inappropriate access or use."

<Files\\Processed x Highly relevant\\2024-08-29 - RNZ - How your social media posts ar> - § 2 references coded [5.14% Coverage]

Reference 1 - 2.50% Coverage

In an email to RNZ, a spokesperson for the Office of the Privacy Commissioner said: "AI tools work based on gathering huge amounts of training data and that does create some new privacy challenges. There are risks of people's information being leaked when these tools answer questions or generate images, and they can also be used in bad ways to facilitate scams and impersonation."

Reference 2 - 2.64% Coverage

While many widely used AI models have blocks designed to prevent them from sharing identifying information about individuals, some models have been tricked into leaking data.
Researchers have found popular image generation models, for example, could be prompted to produce identifiable photos of real people. They could also regurgitate exact copies of medical images and copyrighted work by artists.

Her prison is not the zoo but the hellscape that is Instagram or any Meta-owned product, and having your lifetime work as a poster being used to train Meta's AI.

Reference 2 - 6.53% Coverage

As The Verge reported earlier this month, Meta has been feeding its AI on almost everything users have posted publicly since 2007. LinkedIn has recently been busted for possibly training its AI on user data without updating its terms and conditions. The Elon Muskowned platform X, formerly known as Twitter, helped itself to everyone's posts to train Grok, an AI built by another Elon Musk company, X.ai.

X and LinkedIn have, at the very least, thrown a cursory nod at giving users the ability to opt out, but realistically, publicly available data and imagery have likely been hoovered up into the machine without most of us even realising it.

The firm had assessed that DeepSeek was subject to control by the Chinese government and â€œcollects user personal information from their device and collects prompt information entered by users and stores this information in Chinaâ€ .

Reference 2 - 7.01% Coverage

â€œThereâ€™s a whole raft of issues at play here,â€ said Dan Richardson, CyberCX executive director for strategy and risk.
â€œOf course, the ongoing geo-strategic situation vis-a-vis China has a direct impact on New Zealand and Australia and our institutions and organisations. In particular with DeepSeek, any user generated prompts for that AI tool will end up in a database or data repository based out of China, along with potentially other data that would would be housed on a person's mobile device.â€

<Files\\Processed x Highly relevant\\2025-02-16 - RNZ - Googles AI has been breaching> - § 4 references coded [10.40% Coverage]

Reference 1 - 1.30% Coverage

Google's AI has been breaching name suppression orders put in place by New Zealand courts.

Reference 2 - 2.47% Coverage

Both AI overviews, and a website function showing things people have also searched for, have given the names of people granted suppression while going through a court case

Reference 3 - 4.52% Coverage

Media law expert at Victoria University Steven Price said he was not surprised that AI was outing people with name suppression.
"It seems to me just another development which was always a challenge to our name suppression regime - people sticking something up online and other people finding it," Price said.

Reference 4 - 2.12% Coverage

Price thought it was very unlikely Google's AI could access the names of victims. Google hasn't responded to questions asking if that was possible.
