Honeywell had characterised its offerings as "key technologies which can unlock benefits for justice and corrections facilities", promoting rehabilitation and reduction in offending. Prisoners benefited from "less intrusive environmental and behavioural controls", and guards from relief from work pressures, its report said.

<Files\\Processed x Highly relevant\\2024-05-27 - STF - Newsable- AI could soon be ans> - § 2 references coded [17.51% Coverage]

Reference 1 - 6.50% Coverage

As discussed on Stuffâ€™s daily news podcast, Newsable, it now allows users in some countries to create an AI version of their voice to answer their phone for them.

Reference 2 - 11.01% Coverage

It essentially allows users to screen their calls. When someone rings, it gives an option to send callers to your AI voice. The AI demands to know why the person is calling, and then sends you a transcript of what the caller said, for you to decide if you want to speak to them.

â€œCows behave in some quite odd ways,â€ Morris said. â€œSometimes they push each other through the race, sometimes they run quite fast. Because weâ€™re monitoring in real time, we can really accurately apply the teat spray.â€
The system uses a high-mounted camera that observes cattle movement in real time and uses that information to decide when to apply the spray. â€œThe camera above is to keep it clear of weather and other potential obstructions,â€ said Johnson. â€œThis is a crucial part of machine vision to keep the lens clear, so that you can detect the cow.
â€œWe have a neural processing unit that takes the images from the camera and identifies whether itâ€™s a cow or another thing, and then it will track the cow and then very accurately apply the spray. â€œAs the animal walks through, once the udder comes over the spray pad, we use the four nozzles to apply the spray. The camera can detect when thereâ€™s any dirt or mud on the nozzles and instruct the unit to self-clean â€" the system is intelligent enough to be selfcleaning should manure get on to the spray nozzles.â€
Johns

Reference 1 - 5.04% Coverage

But it not might be â€œa real personâ€ they would be dealing with. Instead, it might be another AI intermediary that the employer was using to scan the internet for candidates and to field applications. Job-hunting in the 21st Century could then become a case of â€˜bots talking to botsâ€™, and if the algorithms hit it off, proposing an interview to both the candidate and employer. That sort of development promises to get rid of a lot of the wasted time and hassle in searching for and applying for new career opportunities, but there could be some complex ethical implications.
