In the survey, released last month, 69 percent of New Zealanders said they had a good understanding of AI and 64 percent thought it would profoundly change their lives in the next three to five years.
Just over half of New Zealanders think AI will make the spread of false information worse - again the second highest level of concern, behind Sweden at 55 percent and compared with a global average of 37 percent.

Misinformation was another top issue, with 61 percent expressing significant concern and another 26 being somewhat concerned. "Social media fact-checking has now become less of a priority for platforms," Maidaborn noted.
"We can see that on X (formerly Twitter) and the Meta platforms like Facebook, they've all stopped fact-checking which makes the responsibility down to each individual." She said the government needed to be more engaged in policy to address mis- and dis-information.
