"But generative AI is incredibly creative, as cats on the moon would suggest, and so they have to contend with moving with the times, and doing so in a trustworthy manner. "And I think that right now not everyone has found the right balance.
"It really shows we can not blindly trust anything particularly that generative AI is producing right now. We have to switch on our brains and be critical thinkers."

Reference 2 - 3.40% Coverage

She says if you're using it for work you should be treating AI as a co-worker - and a very junior co-worker at that. "You need to be able to fact check everything it does. We don't ever give the AI the final word on things."

<Files\\Processed x Highly relevant\\2024-07-18 - SPN - The more you know about AI, th> - § 1 reference coded [2.78% Coverage]

Reference 1 - 2.78% Coverage

The freakouts emerged after a couple of weeks of habitually using OpenAI's ChatGPT4_o and Anthropic's Claude as "thought partners",
"co-workers", or "interns", as we were advised to do during the course. I caught myself anthropomorphising these artificial neural networks, referring to Claude as "him" and "quite chatty and fun", and I listened to and read too much about the philosophical and ethical concerns about AI

When Mediawatch put that to the Weekend Herald's publisher NZME, editor-in-chief Murray Kirkness said AI had been used in a way that wasn't up to scratch. "Any piece of content that uses AI is reviewed, edited and has journalistic oversight. In this particular case, we accept more journalistic rigour would have been beneficial, and we will communicate this to our team," Kirkness said in a statement.

Using AI tools to screen CVs could over focus on data (qualifications and experience) and not take into account other skills, she says.
â€œWeâ€™ve seen a real movement over the past few years, because of the skill shortages here, that employers hire based on â€˜soft skillsâ€™ â€“ so a candidate who perhaps fits the culture of the company, is authentic, reliable, trainable, is a great team player.
â€œThese â€˜potentialâ€™ candidates could be discounted by an AI tool, meaning employers could miss out on the best people for the role.â€ AI is a poor substitute for human contact, she says.
â€œCVs are often not well written. As a recruiter we have to read between the lines, and often pick up the phone and talk to people rather than making assumptions from their CV. â€œUsing an AI tool would be a very black and white result in what sometimes can be a very grey process.â€

<Files\\Processed x Highly relevant\\2024-10-07 - RNZ - Psychologist sounds alarm on u> - § 2 references coded [4.03% Coverage]

Reference 1 - 1.63% Coverage

But one psychologist was worried not all of these apps were clinically safe or user-friendly - meaning people might give up on them and miss out on the help they needed.

Reference 2 - 2.39% Coverage

"Best-case scenario is it's just a bit annoying or frustrating - and then you bail on the product and stop using it. "The other risk is that you might go hunting for a product that feels like a better fit and end up engaging with something unsafe."

Reference 1 - 6.54% Coverage

"Technology is a grey area, it comes with some limitations, and this is the case with AI... we cannot push these technologies into healthcare until we are completely aware of all the downsides and its limitations."
I wouldn't say this technology makes any decisions... this is what I really try to advocate in terms of the usage of AI in healthcare, especially in healthcare because it's very vulnerable, it's a matter of life and death. That's why I never label any of these concepts as diagnostic tools, I always call them a decision support tool and there would be no intention of removing people or replacing them with these systems," she says.

Reference 2 - 10.32% Coverage

"AI could provide a lot of automation, it could make it a lot easier for doctors to provide care, to make diagnoses. That is my goal, to make healthcare more accessible, faster, and more effective, not replacing doctors and nurses, just giving them more tools to be more productive and make their lives easier," he says.
But Shahamiri echoes Madanian's reassurances that AI won't replace real life medical staff.
"What we need to emphasise is that AI is just another tool. It's a tool that doctors and nurses could utilise along with all the other tools that they have to provide better care. The AI itself is not an independent entity, it's a software, but in the end of the day it's the medical doctors and the nurses

who will take action, who will make decisions, who will provide patient care," he says.
And in the end of the day, for the AI sceptics Shahamiri's message is simple: trust your doctor. "If your doctor has trust in using a tool, that means that it has vigorously evaluated and been regulated," he says.

But a recent court hearing centred on whether Singh had perhaps become too relaxed on an Auckland motorway, with a police officer alleging he had laid back for a nap and as a consequence had failed to pull over when she turned on her lights.

Reference 2 - 3.72% Coverage

â€œAt that point they [the prosecution] said he wasnâ€™t asleep, he was inattentive and therefore it was dangerous,â€ says Clee. Both the District Court and the High Court upheld the dangerous driving charge.
â€œThe evidence I have before me is that Mr Singh travelled a considerable distance continuing to negotiate bends on the motorway while failing to recognise a police car blaring its lights,â€ says a judgeâ€™s ruling.
â€œ[Singhâ€™s] fault was to recline his seat to a point, placing him in that situation whereby he may doze or be unable to see and respond to what was going on to the side and behind him.â€
