Name: RISK 5.2 - loss of agency and autonomy; enfeeblement

<Files\\Processed x Highly relevant\\2024-05-07 - RNZ - The New Yorker Kyle Chayka on> - § 4 references coded [20.29% Coverage]

Reference 1 - 2.18% Coverage

You see it in Google searches, Facebook feeds and the ads that follow us online. The end result is that we have stopped deciding what we like for ourselves.

Reference 2 - 2.46% Coverage

Chayka told Afternoons he wanted people to better understand how these forces shape our taste and stop letting a computer-generated formula dictate our experiences and choices.

Reference 3 - 7.01% Coverage

"I think physical spaces have started to adapt to the aesthetics that are popular online." He recalled travelling around the world as a freelance journalist and looking for coffee shops. Most of them, no matter where he went had the same aesthetic. "I could just open Yelp or ... Google Maps and just find this particular style of generic coffee shop and we all know what it is. "[It's] reclaimed wood furniture, often avocado toast on the menu, latte art, you could just find that wherever you went."

Reference 4 - 8.63% Coverage

"It only judges based on data ... it has no feelings, it has no creativity, it has no human soul."
While the marketing message was that recommendations would be personalised, the reality was they would be what was most convenient for the platform, he said. He pointed to Netflix as an example.
"[It's] supposed to be so personal, it shows me what I want to watch. But actually Netflix algorithmically adjusts the thumbnails of the shows and movies to make them appeal to you more.
"Rather than catering to you, it's manipulating you into thinking that you like what's already there, which I think is really sad."

<Files\\Processed x Highly relevant\\2024-05-16 - STF - Tova podcast- I would never gi> - § 2 references coded [13.98% Coverage]

Reference 1 - 7.34% Coverage

She tells Stuffâ€™s Tova podcast that TikTok is dangerous â€œparticularly to kids, and I struggle to understand how people can see kids on something like TikTok and not see what it's doing to them.â€
Marsh says the short reel videos interfere with attention spans andresearch shows they create structural changes in the brain that mimic what you would see in people with addictions and people who started drinking alcohol young.
It also gives an easy fix of dopamine, a neurotransmitter in the brain associated with reward, which drives us to do things - thus forming addictive behaviour.
â€œSo you work hard on a test, you get a good mark and you get a tiny hit of dopamine and you want to do that again. But now we're in a situation where nobody's doing any work, you're watching these short videos, you're getting your dopamine hit over and over again, and your brain is kind of becoming used to that.â€
TikTokâ€™s algorithm makes it unique because you donâ€™t make deliberate choices about the content youâ€™re seeing. The algorithm is powered by AI and creates hyper-personalised collections of endless, scrollable videos based on what youâ€™ve liked, shared, rewatched or stopped watching.

Reference 2 - 6.64% Coverage

She explains that researchers who created fictional accounts pretending to be 13-year-olds and then watched what happened with their feeds over 30 minutes, found that within 2.6 minutes - about 150 seconds - those â€˜13-year-oldsâ€™ were being shown suicidal content and a lot about eating disorders and mental health. They were being shown this content every 39 seconds.
â€œSo very quickly, it sends kids to these videos that romanticise and encourage self-harm and depressive thinking, and thereâ€™s also just some really depraved content on there,â€ says Marsh.
A video going round a couple of years ago showed a young girl dancing, before cutting to a man being brutally murdered. â€œTiktok pulled it but millions of kids had seen it. And once you've seen stuff like that, you can't unsee it,â€ Marsh adds.
In another study, a group of teenagers were put in a room together and asked about social media. â€œA quarter of them said that they'd seen people being beheaded and things like thatâ€¦ thereâ€™s really dark stuff that I just don't think parents understand is on there.â€

<Files\\Processed x Highly relevant\\2024-06-16 - NSM - Using AI could erode childrens> - § 4 references coded [13.24% Coverage]

Reference 1 - 3.37% Coverage

Artificial intelligence (AI) must not be allowed to damage children's ability to thrive and become â€œcompetent democratic citizensâ€ , a new report from think tank, The New Zealand Initiative warns.

Views from some tech entrepreneurs on the potential role of AI in education threatened to erode young people's critical thinking - a prerequisite skill for citizens in a democracy - Welcome to the Machine said.

Reference 2 - 2.07% Coverage

While existing AI models could collate knowledge and produce writing much more efficiently than most humans, children still needed to acquire the knowledge and skills themselves to be able to think critically, the senior fellow from the think tank said.

Reference 3 - 1.32% Coverage

â€œWhen you hear some of the techno utopians, talking about the potential for AI to kind of free us from all this difficult learning, that worries me,â€ he said.

Reference 4 - 6.49% Coverage

Some â€œ21st-century-learning educational thinkersâ€ reasoned students could use AI to â€œlet machines worry about facts and storageâ€ so they could â€œget on with critical thinking and creativityâ€ , he said.
â€œThe trouble with that view is that creativity and critical thinking depend on holding knowledge yourself, in a coherent and structured way.â€
Research, known as â€œthe science of learningâ€ , showed school students needed to encode chunks of knowledge and skills into their long-term memory one step at a time, he said.
If they relied on technology for that knowledge and those skills, they didnâ€™t have a store of knowledge â€œat their immediate disposalâ€ when trying to learn further - instead becoming confused, and ultimately less able to grasp concepts and to reason.

<Files\\Processed x Highly relevant\\2024-07-03 - RNZ - Experts cautiously optimistic> - § 2 references coded [5.91% Coverage]

Reference 1 - 3.96% Coverage

However, Johnston warned the technology should not be used in place of learning basic skills.
"The use of any technology, certainly including AI, in education is that it mustn't undermine children, young people learning knowledge and skills that they'll later need to rely on for further learning," he said.
"A good example is in early mathematics, learning arithmetic. If we allow children to use calculators to do addition and subtraction before they know how to do those things themselves, before they've mastered those skills, then anything that comes later that needs to build on those skills will have shaky foundations."

Reference 2 - 1.95% Coverage

"You are putting them at risk, not only of not developing social skills but actually a lot of children now are starting school with insufficient oral language skills, not only for learning to read and write but to access what's going on in the classroom, to understand what's going on. That is a real concern."

<Files\\Processed x Highly relevant\\2024-07-16 - RNZ - AI could soon attend work meet> - § 1 reference coded [1.76% Coverage]

Reference 1 - 1.76% Coverage

He said if people were attending a GP consultation or meeting that was being transcribed by AI, they could ask if the notes were being checked for accuracy, or how they would be stored.

<Files\\Processed x Highly relevant\\2024-08-02 - RNZ - When an algorithm is your boss> - § 1 reference coded [3.56% Coverage]

Reference 1 - 3.56% Coverage

"I'm interested particularly in gig workers who are working under what we call the 'algorithmic boss', because they have very little control over what this algorithmic boss does, which is why I think we need to pay special attention to that," she says.

<Files\\Processed x Highly relevant\\2024-08-24 - STF - Should firms keep an eye on th> - § 1 reference coded [4.94% Coverage]

Reference 1 - 4.94% Coverage

Humans remain crucial, she says, and companies must determine how much they cede to AI.
â€œWe want a human-enabled future - it's less about an AI-enabled future, it's more a human-enabled future in which AI could play a role to augment our capabilities. As AI gets more advanced and it is able to do more complex tasks, friction points may become slightly less, but my recommendation is for companies to actually think about where's your hard stop? Where are you not willing to have AI to take the wheel?â€

<Files\\Processed x Highly relevant\\2024-08-25 - STF - Jobseeker interviewed by 100 r> - § 5 references coded [5.70% Coverage]

Reference 1 - 0.70% Coverage

While AI may help businesses with a high volume of applications, candidate experience can be â€œpoorâ€ .

Reference 2 - 0.76% Coverage

Venkata Shastry says he has yet to meet a human in his job quest, but has been interviewed by hundreds of robots.

Reference 3 - 1.63% Coverage

â€œI send up to 10 applications a day and Iâ€™ve been looking since March. You donâ€™t get to speak to people any more, you have to write lengthy answers to questions from a bot. If you pass that, you get a video interview -with another bot.â€

Reference 4 - 1.30% Coverage

â€œItâ€™s very time-consuming, with so many online questions, some of them silly, like if I wear a hat, others more personal. Iâ€™m only going for a job as a dishwasher, not the prime minister.â€

Reference 5 - 1.32% Coverage

â€œOne I got through to the video interview, then at the same time I got an email saying Iâ€™d been rejected. â€œItâ€™s very impersonal. You canâ€™t go into a store and ask to speak to a manager.â€

<Files\\Processed x Highly relevant\\2024-09-23 - RNZ - Students using artificial inte> - § 3 references coded [6.47% Coverage]

Reference 1 - 1.40% Coverage

"The stories had been changed - these wonderful pieces of writing - but you couldn't tell they were ever written by the child; [they had] completely lost their voice," he said.

Reference 2 - 4.42% Coverage

"We had some very interesting conversations around, 'Is this still your work?' [and] 'You're really proud of this - but is it really yours?" Some of his pupils said the work was no longer theirs, but others were delighted with the results and wanted to show their parents. It was a great way to get the kids thinking, but Dixon said he was worried about the effects on children's creativity.
"There needs to be a space for children to develop creativity themselves. I don't want to see that replaced by machine learning or an artificial intelligence tool.

Reference 3 - 0.65% Coverage

"Why would we go to the effort of drawing when we can use a tool to do it for us?"

<Files\\Processed x Highly relevant\\2024-10-07 - STF - Nobel Prize in physics awarded> - § 1 reference coded [1.89% Coverage]

Reference 1 - 2.40% Coverage

A recent report cautioned that studentsâ€™ prospects could be damaged if AI replaced traditional learning methods, but also said there were education-specific AI tools that looked promising.

<Files\\Processed x Highly relevant\\2024-11-05 - RNZ - Why AI wont ruin childrens edu> - § 1 reference coded [6.58% Coverage]

Reference 1 - 6.58% Coverage

A new report calling for a science-based approach to using AI in classrooms raised concerns about how using it too much before learning the basics may slow down a student's learning. Couillault shares this concern.
"It's a walk before you can run thing, and when you think back to the evolution of how we do maths, where we used to do maths with bits of paper and then it moved to abacus and then it moved to calculator - through all that evolution we said, 'actually we need you to know how the thinking works around that in order to have an understanding later on and be able to calculate it," he says.

<Files\\Processed x Highly relevant\\2024-11-08 - WAA - Education experts urge care> - § 1 reference coded [4.92% Coverage]

Reference 1 - 4.92% Coverage

“We as a computer science department, are just taking it on a case-by-case situation at the moment, and we’re aware that it’s out there and students are using it, but we don’t want it to affect the abi l ity to think and form ideas for themselves,” says Keegan.

<Files\\Processed x Highly relevant\\2024-11-18 - RNZ - AI tutors show promise but sho> - § 3 references coded [13.98% Coverage]

Reference 1 - 3.75% Coverage

Studies showed AI could help raise achievement, but also that it could lead to worse outcomes if it did too much for students, he said. "One of the risks of the AI systems is if they aren't set up in an appropriate educational way, then they tend to be too helpful."
"They tend to immediately help the student to go straight to a perfect answer and in doing so, that can actually remove an opportunity for that productive struggle," he said.

Reference 2 - 6.51% Coverage

AI would have a huge impact on schools, but mostly as a background tool that would improve rather than replace classroom learning, Smith said.
"That impact is going to happen in a whole bunch of little pieces. So we're going to get hopefully a whole lot of small improved educational experiences like this. I don't see AI as necessarily completely changing what a classroom looks like. I think what we're going to see is an augmentation.
"I see this as almost an underlying, base technology. At the moment when people think AI they see

chatbots. I actually think that more and more we're going to see it integrated into the deeper, underlying layers of software. It's just going to enable us to do things that were previously very difficult or very time-consuming."

Reference 3 - 3.73% Coverage

He said the company gave schools the option of enabling or disabling the AI components of its software and most were happy to use it. Wang said using chatbots as AI tutors "might not necessarily be the most instructionally-responsible thing to do."
Rather, he expected students would use AI to find the most relevant sources of information or even to summarise those sources or give students feedback on their own summaries of the sources.

<Files\\Processed x Highly relevant\\2024-12-19 - NSM - Taking art from Artificial Int> - § 1 reference coded [2.89% Coverage]

Reference 1 - 2.89% Coverage

That led to the question: Is it possible that robots could rule the world through AI? Another painting shows a line of robots giving instructions to a human.

<Files\\Processed x Highly relevant\\2025-01-28 - RNZ - AI integration in education mu> - § 3 references coded [7.36% Coverage]

Reference 1 - 2.14% Coverage

"For our region, careful planning, cultural sensitivity, and ethical considerations are critical in maintaining human agency and ensuring that these technologies serve the needs of all our diverse communities."

Reference 2 - 2.88% Coverage

However, he said with AI's advantages and opportunities come "significant concerns and challenges". "As algorithms increasingly influence what students learn and how they learn it, there is a risk that learners may cede control over their educational journeys to automated systems.

Reference 3 - 2.35% Coverage

"Secondly, curricula should be developed to not only include technical literacy but also skills such as critical thinking, creativity, and ethical reasoning-skills that remain uniquely human and are less susceptible to automation."

<Files\\Processed x Highly relevant\\2025-02-04 - RNZ - New Zealand public services re> - § 2 references coded [3.52% Coverage]

Reference 1 - 1.51% Coverage

Some academics want greater transparency in the government's use of AI, saying Kiwis have the right to know when decisions about healthcare and social services aren't being made by humans.

Reference 2 - 2.01% Coverage

"If a government service or government department is using an AI system, then the public should

know about it, and should know as much as possible about how it works, and how it's used... we think that is going to be helpful in creating public trust."

<Files\\Processed x Highly relevant\\2025-03-14 - STF - Is AI in politics the final te> - § 1 reference coded [1.28% Coverage]

Reference 1 - 1.28% Coverage

â€œI think thereâ€™s a role for AI in terms of doing the automatic transcription of speeches to enable accessibility through captioning, but this should ideally be checked by a human.â€

<Files\\Processed x Highly relevant\\2025-03-18 - RNZ - The future of warfare- Killer> - § 2 references coded [4.90% Coverage]

Reference 1 - 0.90% Coverage

"Thunderforge marks a decisive shift toward AI-powered, data-driven warfare... respond to emerging challenges at machine speed ," it said.

Reference 2 - 4.00% Coverage

CSIS used 400 scenarios and 60,000 questions in the first major benchmarking study of how generative AI approached international relations and foreign policy decisionmaking. "The results reveal a concerning trend," researchers said. "Some widely used AI models exhibit a marked bias toward escalation in crisis scenarios compared to others.
"This finding has serious strategic implications. If AI models systematically favour escalation, they could skew policy analysis toward more aggressive responses in conflict-prone situations, increasing the risk of miscalculation in high-stakes geopolitical environments."

<Files\\Processed x Highly relevant\\2025-03-25 - RNZ - INZ introducing automated deci> - § 4 references coded [6.14% Coverage]

Reference 1 - 1.53% Coverage

utomation has been a contentious subject for INZ, with officials suggesting it was a sensitive subject and academics concerned it could either bake human bias into decisions, or affect staff decisions through profiling.

Reference 2 - 0.84% Coverage

Academics said caution was needed on basing decisions on risk profiles as humans often deferred to a computer's judgment.

Reference 3 - 2.90% Coverage

The Ministry of Social Development has developed guidelines for business rules, data-based algorithms and statistically or analytically derived patterns in machine learning or artificial intelligence, and spells out checks that are needed for transparency, oversight and to overcome bias. Bishop said similar safeguards would be in place for INZ's automated decisions, which were already enabled through legislation.

Reference 4 - 0.87% Coverage

ck whether that criteria had been met or whether we have to go back to the applicant and ask them for some more information."

<Files\\Processed x Highly relevant\\2025-04-09 - RNZ - Ministry of Social Development> - § 2 references coded [2.99% Coverage]

Reference 1 - 0.92% Coverage

Ika said that would increase the ministry's workload but these decisions should be made by humans.

Reference 2 - 2.07% Coverage

"This raises significant concern about how the use of automated systems will apply where the sanctions provisions involve some form of evaluative judgement, for example those relating to money management and community work."

<Files\\Processed x Highly relevant\\2025-04-14 - RNZ - AI widely used in public secto> - § 2 references coded [4.16% Coverage]

Reference 1 - 2.44% Coverage

There was further concern that AI could discriminate against workers and lead to missed job opportunities with 68 percent worried about the use of AI in recruitment and promotion decisions.

Reference 2 - 1.72% Coverage

Increased workplace surveillance and erosion of trust in public and community services were other concerns highlighted in the report.

<Files\\Processed x Highly relevant\\2025-04-24 - RNZ - AI use for job seekers- Defaul> - § 7 references coded [12.42% Coverage]

Reference 1 - 0.97% Coverage

Using AI algorithms to to renew expired Jobseeker benefits automatically could result in 'computer says no' discrimination, experts are warning.

Reference 2 - 0.81% Coverage

MSD said such AI would not be used to decline Jobseeker Support benefits - that decision would be made by a staff member.

Reference 3 - 4.88% Coverage

Victoria University of Wellington professor and AI expert Dr Simon McCallum said the potential for bias was too great. "There are certainly areas to be concerned about," he said.
"Once an automatic decision is made the human won't think fresh about the situation, they'll just use whatever the computer says or default to a 'computer said no' situation." McCallum said human empathy can be inhibited by such a process.
"When you are the human who just gets a group of people who are potentially problematic your mindset shifts into a 'I'm dealing with people who are problematic' and you get that expectation

issue." He said such automated decisions would need human oversight in a way that could make them less efficient.

Reference 4 - 1.50% Coverage

"It provides a framework for good practice and introduces specific automatic decision making safeguards, including the requirement that our clients get their correct entitlement and are not discriminated against," Gill said.

Reference 5 - 0.90% Coverage

AUT computer science professor and AI expert Dr Edmund Lai said some degree of bias is unavoidable in both human and computer systems.

Reference 6 - 1.91% Coverage

"If the tool is used in exactly that way I don't see any problems because you're just saving manpower for screening all the routine cases where reapplication is successful and then a human will look at those other ones and rexamine those cases." He said it would need human safeguards.

Reference 7 - 1.44% Coverage

Lai said it would not be an appropriate use of the technology to cut benefits or decide other monetary sanctions. All agreed such use of the technology would need human oversight and that is not currently regulated.
