Once you start noticing, you can see it everywhere: The 'sameness' of style, music, art and even food. New Yorker staff writer Kyle Chayka and author of new book Filterworld How Algorithms Flattened Culture blamed algorithms that direct our attention to what works best for digital platforms.

Reference 2 - 4.93% Coverage

"An algorithm is just an equation ... and what they judge by is really engagement. So it's what's already popular, what are other people looking at, what are other people clicking on and I think that tends to reinforce this sort of homogeneity. "It funnels us towards the same styles or aesthetics or sounds that work for the biggest number of people."

But in terms of the general AI market: â€œCompanies whoâ€™ve had a credible standalone product for some time now find their offerings commoditised by the bigger players.â€
A product could still be excellent, but now faced new, often cheaper competition from the likes of OpenAI, Microsoft, Google and AWS, and a wave of start-ups building apps that incorporate their generative AI tools, into the mainstream since ChatGPT emerged in November 2022.
In April, Cross told Forbes Australia the popularity of chatbots had led to a â€œchallenging timeâ€ for companies in the sector.

"That just sent a shock of fear through media companies around the world because so much of their online revenue is ad revenue that's generated from Google clickthroughs," McLauchlan said.

Reference 2 - 2.52% Coverage

"So all of that money will disappear from an industry that is already going bankrupt quite quickly. Google made about half a trillion dollars last year, in New Zealand dollars, and the New York Times made about 1 percent of that - and that's the most profitable news media company, at least in print media. So that sort of gives you an idea of the scale of the two competing organisations."

Flexibility was another watchword. â€œOther ... AI assistants are very fixed. You have to use a specific large language model and a specific platform,â€ Compagnone said. â€œOurs is more like a pick-and-mix, where you can use any large language model you want to. Itâ€™s LLM-agnostic. â€œAnd it can sit on your preferred platform, which might be AWS, Azure or Datacom.â€ (Datacom, easily the largest homegrown IT services outfit with its more than 6000 staff, operates four of its own data centres in New Zealand, and two across the Tasman in partnership with AirTrunk.)

<Files\\Processed x Highly relevant\\2024-10-19 - RNZ - Why Google Maps cant pronounce> - § 2 references coded [29.10% Coverage]

Reference 1 - 9.37% Coverage

Jones said the quality benchmark for te reo pronunciation is much lower for global tech companies such as Google, but the bigger problem is that no proficient Māori language speakers are involved in the creation of AI tools.
"When we look at Open AI tools and Google tools, while they are making big advances, it's clear there are no proficient Māori language speakers involved, because if there were, they wouldn't release tools with such bad pronunciation." It is important to recognise that big tech is not going to save te reo Māori, he said.

Reference 2 - 19.72% Coverage

"I think the solution from my perspective is to benchmark against Māori standards not some global benchmark that was established for all languages by people with no Māori language expertise or understanding of the language decline context here in New Zealand. "This means investing in local data science solutions that support accuracy and precision." Another part of the solution included investing in Māori lead organisations with proficiency in te reo, Jones said.
"When we think about pronunciation I guess we've got to make a decision are we looking for excellence or are we happy with mediocre. Sometimes purposefully doing harm to a language is worse than doing nothing at all." Māori language models - such as Te Hiku Media's model - provide an opportunity to set the benchmark much higher, he said.
"Providing quality examples of pronunciations like place names... these enhance the language acquisition opportunities for language learners and mispronunciation often obscures the intelligence we hope to convey through speech... What I would say is that accepting a 50 percent accuracy as a benchmark for te reo Māori is just unacceptable."

<Files\\Processed x Highly relevant\\2025-03-20 - WKT - Good luck getting a job withou> - § 2 references coded [4.90% Coverage]

Reference 1 - 3.02% Coverage

The use of AI by employers to search for and screen candidates raises the obvious risk of injustices. Candidates who didnâ€™t suit their computer algorithms might find themselves increasingly shut out of the jobs market. But AI might be preferable to blunter, less intelligent tools that recruiters already use to screen and filter out candidates.

Reference 2 - 1.87% Coverage

But already, job candidates who arenâ€™t at least running their cover letters through some sort of AI engine for suggestions may be missing a trick, and the disadvantage faced by the uninitiated is only likely to grow

Reference 1 - 2.58% Coverage

TikTok may have pulled that monumentally stupid chubby filter app, the â€œAIâ€ one that shows you what youâ€™d look like if, God forbid, you became fat, but like putting a sticky plaster on fractured tibia itâ€™s too little, too late.

Reference 2 - 2.53% Coverage

Then, like a turd wrapped in tinsel, the chubby filter clips arrived. An endless cycle of thin women hand-wringing (and giddily cackling) over an AI illusion of becoming the worst possible thing you could ever be as a woman: fat.

<Files\\Processed x Highly relevant\\2025-04-04 - STF - AI wrote my explainer, now its> - § 1 reference coded [3.64% Coverage]

Reference 1 - 3.64% Coverage

â€œMy main concern is that we are likely to have a divide between those who are using and developing AI and those who are not. As AI is somewhat delayed in NZ, we could be in trouble in the coming years, especially if our AI talent goes overseas due to a lack of opportunities here. In this context, you may be right to feel pessimistic.â€

<Files\\Processed x Highly relevant\\2025-04-09 - BOP - MSD denies plans for automated> - § 2 references coded [19.82% Coverage]

Reference 1 - 10.38% Coverage

A new clause in the Social Services Amendment Bill expands the decisions that can be made by

automated systems to include sanctions. Cabinet has agreed to introduce new obligations and sanctions for job seekers this year. The Salvation Army is warning that if the door opens for AI to decide benefit sanctions, it cannot be easily closed.
Policy analyst Ana Ika said the organisation opposes the Governmentâ€™s amended bill, which would allow more sanctions as well as paving the way for AI to make more decisions on benefits.
â€œThe bill will make things a lot worse for those that we support, it will push a lot more people into poverty. It will create a lot more barriers and difficulties for those that we support to be able to access the help that they need.â€

Reference 2 - 9.44% Coverage

Both the Salvation Army and Law Society have called for the clause to be scrapped. â€œAutomated systems risk making inappropriate decisions that could increase hardship for those we support,â€ it said.
MSD said it plans to use AI to decide whether people applying to renew their Jobseeker benefit have met their obligations, but automatic decision-making would not be used to decline these. Under the proposed changes, people on this benefit would have to reapply every six months â€" instead of annually.
â€œWe understand the argument around efficiency but efficiency will come at a cost and for us that cost is increasing poverty, making things a lot more difficult for those that we support.â€

<Files\\Processed x Highly relevant\\2025-04-09 - RNZ - Ministry of Social Development> - § 1 reference coded [7.77% Coverage]

Reference 1 - 7.77% Coverage

"If you open this legal loophole here, how far can you take it? AI is artificial, but it's not that intelligent - the intelligent part is still being worked out, but because of that there are decisions that could be made that are unfair, that does marginalise those who are on the fringes of society and makes things a lot worse."
Both the Salvation Army and Law Society have called for the clause to be scrapped, in submissions to the select committee considering the bill.
The Salvation Army's submission stated that automatic decision making "cannot account for the complexities we often see in the individuals we support", such as financial hardship, addictions, mental health issues or unstable living conditions.
"Automated systems risk making inappropriate decisions that could increase hardship for those we support," it said.
