Detection programmes are not foolproof and the results cannot show how big a role AI had in the creation of any given article.
The articles in question may still comply with NZME's policy, which allows for AI to help create content provided journalists oversee its use.

<Files\\Processed x Highly relevant\\2024-08-11 - RNZ - The surveilled society- Who is> - § 3 references coded [11.45% Coverage]

Reference 1 - 10.13% Coverage

The selling of surveillance for safety and security's sake has been very successful around the world, and in New Zealand.
It has proceeded apace, with barely a blip - though just this week a legal challenge to it has been playing out in the Auckland District Court, without any coverage by the media.
In that hearing, expected to involve at least four separate criminal cases challenging police use for evidence of footage gathered without a warrant from CCTV retail cameras linked to automated number plate recognition (ANPR) systems, the ruling was reserved.
Another wee blip came after RNZ reported last year that new billboards at Wellington's train stations would sport cameras from the same Swedish company that supplies surveillance products to China. In a quick-about, the billboard company ditched the cameras. A third speed bump came just last week, when NZTA deferred using number-plate spotting cameras on a highway (see below).
The march is mostly one way, though - including to the bank for the tech-makers and marketers, who are known to protest at the media calling their products "surveillance". Such sensitivities have not put off governments spending on public-private hybrid systems. New Zealand has its own, used by powerful state agencies, the police and Immigration. Many of the camera systems could run facial recognition (FR). Sometimes you are just asked to trust the FR function is not switched on.

Reference 1 - 1.51% Coverage

First-ever police policy on facial recognition strict in some ways, loose in others A ban on use on live footage remains, reflecting caution But a lack of external oversight runs counter to Europe's world-first AI law

Reference 2 - 1.26% Coverage

The police already use facial recognition in at least five different ways, but their lack of policy around it has been evident since a misguided trial back in 2020, on Clearview AI.

Reference 3 - 1.81% Coverage

The EU's new AI law allows some use on live footage within strict limits, but it pulled back in May from curtailing its use far more. The EU also imposes some external oversight, which is missing from New Zealand's new policy; here, the police audit themselves.

Reference 4 - 32.76% Coverage

The new, six-page policy said FRT's use would be "approved, controlled, monitored, and governed", with internal auditing where possible, and only deployed on images police have lawful access to. "This policy ensures that appropriate safeguards are in place for Police's use of FRT and the storage of personal information, and that use of FRT is lawful, proportionate, and appropriate in a New Zealand policing context."
Lawful access is key: Police have thousands and thousands of unlawfully gathered images - mostly of Māori young people - which they are trying to find a way to delete, on the orders of the Privacy Commissioner.
Also, police have access to thousands of privately owned CCTV cameras, many of them linked into networks that have facial recognition capability.
"Police does not use the live FRT capabilities of third-party systems," said the policy.
This comes three years after they set up an independent expert panel on emerging tech, and began putting out a list of the various technologies, in an attempt to be more transparent. The list is not exhaustive, leaving off, for instance, tech police use to scrape social media.
The new policy lists five ways police already use FRT, such as in investigations for retrospective matching against the several million images of people they have in databases; in missing person inquiries; to help identify dead people; and in registering firearms owners.
They use the BriefCam system with facial recognition to speed up going through hours of video. The French police are in hot water over their use of BriefCam, which is unlawful under their country's ban.
A second tool with FRT used locally, from Israeli firm Cellebrite, can break mobile phone encryption.

Social services in Australia were criticised last year for using it against welfare fraudsters.
Lynch and other researchers have found New Zealand police were comparatively cautious in rolling out facial recognition, especially compared to US law enforcement, and the new policy reflects this in its ban on live use.
"Police will not make decisions regarding the implementation of live FRT until the impacts from security, privacy, legal, and ethical perspectives are fully understood, and it has engaged with communities and understood their views," it said.
However, the EU is much more explicit in moving to ban some types of FRT among the biometric technologies that pose an "unacceptable risk" and a threat to people.
Its blacklist includes biometric identification and categorisation of people, and most forms of live FRT.
The EU's world-first AI Act provides an 'out' for real-time use for serious crimes. It is stricter than New Zealand over delayed use, signalling a judge or other external sign-off would often be needed. RNZ asked police for comment on the lack of oversight in the new policy, or it not instituting a "serious crimes" threshold for FRT use. The local policy said proportionate use would need to account for human rights and privacy.
The tech - there are several police use - must have "sufficiently high accuracy and ... not operate with an unacceptable level of bias or discrimination". Images must be retained, stored and destroyed in line with other police rules around those.
Often images can be kept for months; also, FRT involves private companies' tech systems that sometimes store the data in cloudcomputing centres in Australia.
The policy does not mention Māori or Te Tiriti at all. RNZ has asked police why not. Māori lawyers have said Māori consider biometrics a taonga.
It has been released while the Office of the Privacy Commissioner is still working on a code for biometrics (your face is one biometric, as are your fingerprints, and even your gait). Scotland in 2021 became the first country to implement a legally binding code of practice for biometrics in policing.
Lynch, in new research into controls in May, said: "There are many examples of good practice in terms of robust guidelines or oversight by independent observers and reviewers, but there is the ever-present risk of internal policy settings changing due to changes in leadership or attitudes."
Police said: "As part of the development of the policy, it was shared with the understanding policing delivery independent panel. We sought input from our internal Māori, Pacific, and Ethnic Services group, as well as Māori members of the expert panel on emergent technologies.
"We have also kept the Office of the Privacy Commissioner informed throughout the process and are in regular contact with them on. There is broader work in progress around how police treat Māori data, which is also an ongoing conversation across many government agencies."

The EU

Reference 4 - 8.85% Coverage

Europe's General Data Protection Regulation (GDPR), possibly the world's toughest data protection rules, has created obstacles for Meta and other companies looking to improve their models with user-generated material.
In June, Meta confirmed it would delay training its large language models on Facebook and Instagram content from its users in the European Union and United Kingdom.
Ireland's Data Protection Commission, which oversees Meta's compliance with GDPR said it welcomed the decision and would continue to engage with the company.
"The GDPR is kind of a gift in this aspect, because the EU is a large and powerful enough economic force that large companies tend to comply with their regulations rather than abandoning the European market - which means they already have compliance processes for the GDPR built into their systems," Robins said.
But legal solutions are imperfect, he added, noting ongoing lawsuits arguing big chunks of the early data gathering for big AI models like OpenAI's ChatGPT were against not only the GDPR, but a lot of copyright law.
"There's a strong incentive to just grab whatever you can and try to move quickly enough that by the time people start paying attention, you're too big and influential to meaningfully punish for any indiscretions you may have committed on your way to the top."
NZ law

The government pushed back, saying military AI initiatives had multiplied, so it was concentrating on UN efforts and a US-led 'Political Declaration on Responsible Military Use of AI and Autonomy'. "New Zealand's voice is clear," said Associate Foreign Affairs Minister Todd McClay in a statement.
New Zealand had signed the the Bletchley Park AI safety summit declaration - though a year late in 2024 - and its successor summit, the Paris declaration, last month, although the Paris meeting carefully skirted military issues.
McClay has oversight because the coalition government did not appoint a Disarmament Minister, the second time a National-led government has downgraded the portfolio since it was set up after the nuclear-free legislation of the 80s. An expert working group on killer robots set up in 2022 had just a few meetings, before MFAT pulled the plug last year.
Twyford, Labour's spokesperson on disarmament, said the government was not doing enough to "push back" against the big powers, the US, China, India and Russia that did "not want a bar" of military AI rules. "If we don't, the consequences for the species could be horrific. "I'm just not seeing evidence from the current government that they're making this a priority."
Twyford in 2021 got Cabinet to commit to supporting international rules. However, Cabinet caveats then carved out room for the Defence Force to remain interoperable with US and Australia's advances in AI technology.
Twyford and Walsh illustrate the splits that drag back the efforts on new norms: Walsh said the UN was ineffective, with any moves easily vetoed, but Twyford said the UN was the key forum to launch AI debates, that could lead to separate treaties that could not be vetoed, as happened with anti-personnel landmines in the 1990s.
