Mobii Green Energy boasts of its â€œbreakthrough technologyâ€ that â€œrevolutionisesâ€ the production of hydrogen. The process removes the need to store and transport hydrogen, allowing it to be generated on site, slashing the usual cost, the company says. If true, it would be a game changer, but itâ€™s not clear what the claims are based on. Tseng himself is not an engineer â€" he has a bachelorâ€™s degree in psychology â€" and The Press could not find any further detail about this technology. Emailed requests for comment to Mobii Green Energy and Tseng were not returned.
The Press also sought comment from the New Zealand Hydrogen Council, the local industry group, about the plausibility of the claims, but did not receive a response.
Even Gu, from North Rakaia, is somewhat in the dark. He understood that the technology was developed by a Taiwanese engineer who had worked for major companies, and it worked by using only solar energy to generate hydrogen, cutting out the standard electrolysis process. Such technology does exist, but is not used at the scale required for this project.
â€œThis emerging technology is a highly guarded trade secret,â€ Gu said. â€œI am just guessing how it works.â€

McCallum also warned that it will not be long until this use for AI becomes commercialised. "We might soon see companies buying product placements in AI. So when you ask the AI for recommendations, it won't give you just any recommendations, it will give you product recommendations from people who have paid to give you those specific ones."

â€œThis can take away considerable time and resources of investigators who are trying to detect and safeguard real children both here in
New Zealand and internationally,â€ he said.
