Focus on key areas, and accept that youâ€™re not going to get to 100 per cent. There are technical elements to a clean-up, such as identifying and dealing with duplicates, but there are also legal factors such as data sovereignty, or making sure files that need to be stored in a New Zealand data centre are indeed onshore.

Bodycams - Police still do not have these, but prison guards and checkout operators do. Woolworths rolled them out at almost 200 stores in April, with footage downloaded and stored by Singaporean company CSE. Rollout - 2024.

Reference 2 - 2.29% Coverage

Congestion charging and tolling - The cameras and new back office tech for these will ensure all that data you generate every day moving about is not lost to the ether, but stored, possibly anonymously, somewhere, possibly in a cloud-computer hypercentre in Sydney or Canberra, for help in generating the next business case.

Reference 3 - 1.73% Coverage

A crucial development is that public agencies used to buy the hardware and run it, and so keep the data in-house; now they often buy in complete packages in a build-operate contract with the tech company that often harvests and stores the data.

That data collected by DeepSeek was held in China was of concern as all private sector organisations have to assist state intelligence agencies under Chinese law, Richardson said.
â€œOur understanding or assessment is this may extend to influencing technology designer standards, and accessing data held in the private sector, and potentially exploiting any remote access to devices enjoyed by Chinese companies that they may leverage for legitimate purposes. If you look at the track record of those Chinese intelligence agencies, they are very interested in unique intellectual property that organisations will hold, so there is a risk that downloading and using this AI assistant on a device that also holds data that is sensitive or commercially sensitive, there is a risk to that data.â€
Richardson said DeepSeekâ€™s rapid development showed that Chinese firms were reaching parity with firms from other countries, and â€œthey seem to be able to do that in a very efficient and quick wayâ€ .

Reference 1 - 2.47% Coverage

If usage is detected, a package of still images and CCTV footage is sent, encrypted, to a Acusensus server on the Amazon Web Services Cloud database. This is in Australia, but once a database opens in New Zealand, the rules call for it to be sent there.
