Police are looking to boost their technology for scanning and storing biometric identification data - including fingerprints, scars, tattoos and faces.
There was also plans to upgrade the existing 50 fingerprint scanners at police stations and add another 130 portable scanners.
Meanwhile, the police have just finished destroying thousands of unlawfully obtained fingerprints, ordered by the Privacy Commissioner.

Dr Karaitiana Taiuru, a leading Māori AI and data ethicist, told Midday Report people of colour were unfairly discriminated against by biometric technology used by police.
"We've already seen a history of Māori being fingerprinted and photographed at such high proportions and the police didn't actually have a right to take that data in the first place. Māori tech expert concerned over police's expanding biometric data use (3 min 58 sec)
"My other concerns are that the police haven't engaged with their own internal expert team and nor with the Office of the Privacy Commissioner." He said it was unclear where the identification data such as Māori tā moko would be stored.
"Will it be stored in New Zealand? Will it be stored overseas? Who will have access to those images?

Reference 3 - 16.15% Coverage

The police tender shows officers expect to capture 600,000 images a year of fingerprints left behind at crime scenes. Dr Taiuru wanted to know how police would accumulate that large number of prints and whether they were justified in doing so.
"I find it very concerning that they're going ahead and now they're looking for more intimate information about individuals without consultation." He said he was worried police had not learnt despite having to recently destroy unlawfully obtained prints. Police did not directly respond to Dr Taiuru's concerns when asked by RNZ. In a statement, a spokesperson said police were not seeking greater fingerprinting powers.
"We are seeking information on what devices are available in the market which would enable us to replace a physical system with a digital system capable of meeting current and future needs. "It is important to note that we are only in the Request for Information (RFI) stage of this process and no decisions have been made."

"Although Meta said in 2023 it's only using public posts to train its AI, its privacy policy says it can use any of the contents on its platforms."
He listed some of the information we consciously - and unconsciously - share with the social media giant: Posts, photos, messages, apps, purchases, interactions, connections, devices, internet service provider, language, location information, and more. "Any of this information can be used to train the AI, but whether it is or not is hard to say. It's challenging to pin down exactly what's happening."

Europe's General Data Protection Regulation (GDPR), possibly the world's toughest data protection rules, has created obstacles for Meta and other companies looking to improve their models with user-generated material.
In June, Meta confirmed it would delay training its large language models on Facebook and Instagram content from its users in the European Union and United Kingdom.
Ireland's Data Protection Commission, which oversees Meta's compliance with GDPR said it welcomed the decision and would continue to engage with the company.

"The GDPR is kind of a gift in this aspect, because the EU is a large and powerful enough economic force that large companies tend to comply with their regulations rather than abandoning the European market - which means they already have compliance processes for the GDPR built into their systems," Robins said.
But legal solutions are imperfect, he added, noting ongoing lawsuits arguing big chunks of the early data gathering for big AI models like OpenAI's ChatGPT were against not only the GDPR, but a lot of copyright law.
"There's a strong incentive to just grab whatever you can and try to move quickly enough that by the time people start paying attention, you're too big and influential to meaningfully punish for any indiscretions you may have committed on your way to the top."
NZ law

While it reads like vaguely threatening legalese, it is unfortunately completely meaningless and an example of "copypasta", a delicioussounding but pernicious online and viral form of the old school chain letter. When you pronounce the "pasta" bit like paste, the mechanism and form are simple. Aided by conveniently sharable "add yours" stickers on Instagram, it's just false information in text form that's repeatedly copied and pasted online. Versions of it crop up occasionally, with pseudo-copyright notices circulating widely on Facebook in 2012.
Posting the message does nothing to revoke Meta's permission to use your data to train its AI as it races alongside other big tech companies to win the AI arms race. Multibillion-dollar investments are being made in generative AI, and, rudely, not even the star of The Hours and May-December can stop them. Meta has said it will spend $35-$40bn on AI this year. That news was richly rewarded in April with a share price bump. Meta's stock is now up 37% this year as of July 31. This recent round of copypasta wielded by an Academy Award-winning actress doesn't even register as far as slaps on their Richy Rich wrists go.

Reference 2 - 6.60% Coverage

As The Verge reported earlier this month, Meta has been feeding its AI on almost everything users have posted publicly since 2007. LinkedIn has recently been busted for possibly training its AI on user data without updating its terms and conditions. The Elon Muskowned platform X, formerly known as Twitter, helped itself to everyone's posts to train Grok, an AI built by another Elon Musk company, X.ai.

X and LinkedIn have, at the very least, thrown a cursory nod at giving users the ability to opt out, but realistically, publicly available data and imagery have likely been hoovered up into the machine without most of us even realising it.

Reference 4 - 8.48% Coverage

â€œOur understanding or assessment is this may extend to influencing technology designer standards, and accessing data held in the private sector, and potentially exploiting any remote access to devices enjoyed by Chinese companies that they may leverage for legitimate purposes. If you look at the track record of those Chinese intelligence agencies, they are very interested in unique intellectual property that organisations will hold, so there is a risk that downloading and using this AI assistant on a device that also holds data that is sensitive or commercially sensitive, there is a risk to that data.â€
