Reference 1 - 2.85% Coverage

Gavin Udy is the project delivery specialist for the Environmental Implementation Team at Otago Regional Council. And one of his main projects is a trial to see if drones can hunt down and eradicate wilding pines, basically by themselves. "A drone goes out and it searches a predetermined area, and it flies through this area searching, for wilding conifers."

Reference 2 - 6.98% Coverage

Gavin says the drone uses artificial intelligence (AI) image detection trained on images of various kinds of trees – allowing it to identify wilding conifers all by itself. And it doesn't end there.
"It can then take a GPS location of where that tree is. It can take a photograph of that tree and it can estimate the size of that tree in terms of its height and also its diameter of all of its foliage. After it does its survey flight, all of that information is collated." At this point, the data is checked by a human operator, then the data is passed along to a second, larger drone loaded with herbicide.
"And that drone is then able to go out, following a flight path that has been analysed as being the most efficient flight path, and it's able to go along and spray all those trees, spraying the right amount of herbicide onto that tree – just enough to kill it."
Gav

â€œWe had an understanding of what else was out there on the market and going back to first principles we thought â€" how do we actually automate this procedure?

Reference 2 - 18.02% Coverage

â€œThe origin of the teat spray was an understanding of the limitations of other teat sprayers in the market, especially around coverage, usage and effectiveness of the teat spray.â€ And that accuracy of application is affected by animal behaviour and accidental interference.
â€œCows behave in some quite odd ways,â€ Morris said. â€œSometimes they push each other through the race, sometimes they run quite fast. Because weâ€™re monitoring in real time, we can really accurately apply the teat spray.â€
The system uses a high-mounted camera that observes cattle movement in real time and uses that information to decide when to apply the spray. â€œThe camera above is to keep it clear of weather and other potential obstructions,â€ said Johnson. â€œThis is a crucial part of machine vision to keep the lens clear, so that you can detect the cow.
â€œWe have a neural processing unit that takes the images from the camera and identifies whether itâ€™s a cow or another thing, and then it will track the cow and then very accurately apply the spray.
â€œAs the animal walks through, once the udder comes over the spray pad, we use the four nozzles to apply the spray. The camera can detect when thereâ€™s any dirt or mud on the nozzles and instruct the unit to self-clean â€" the system is intelligent enough to be selfcleaning should manure get on to the spray nozzles.â€
Johnson said with the various levels of automation on farms, he believes the walkover sprayer easily fits with the simple farming systems in New Zealand.
â€œItâ€™s a tack-on piece of equipment that fits with our customer base,â€ he said.
Morris said the device automated the process without compromising the health of the animal â€" and the farmer got a good productivity gain.

The tech can be used to measure whether predator trapping and reforesting efforts are increasing native bird life.
Cacophonyâ€™s device, the Bird Monitor V2, consists of a microphone, some smartphone-like hardware, a waterproof case and a power supply.
Once the birdsong is recorded, the audio file is uploaded to a server, where artificial intelligence (AI) developed by Cacophony classifies the bird calls by species and issues reports to users.
The AI identified about 20 bird species and more would be added as the technology learned to distinguish species from background and human noise, Hellicar said.
Human voices can be distinguished from other sounds and those recordings are deleted. The AI reports on the total amount of birdsong and how it changes over time. The package â€œautomatesâ€ bird monitoring, according to Lawrence Smith, a leader at ReWild Wainui in Akaroa Harbour.

In the past few years, Netsafe has been working with the Alan Turing institute in the UK to use AI, not to monitor hate speech, but to respond to it. â€œThe thing that we do see often in the progression of conversations is things can start quite small and escalate quickly,â€ Lyons said. â€œTo diffuse the tension and the heat in those conversations early, we know that that can lead to the harmful speech not occurring. â€œIt's really promising where weâ€™ve seen situations where AIâ€™s been able to try and attempt that.â€

<Files\\Processed x Highly relevant\\2024-07-18 - SPN - The more you know about AI, th> - § 1 reference coded [5.69% Coverage]

Reference 1 - 5.69% Coverage

When we learned how to build a custom GPT, the penny really dropped, and the existential heat came off. Using the word “build” belies the simplicity of this task. It sounds very impressive, but no coding is required. I’d bet there are classrooms full of nine-year-olds who have known how to do this for a year already. Anyone can create a version of ChatGPT for a specific purpose, and it’s only as good as the information you give it and the instructions you write for it. As with anything data-related, it adheres to the old computing adage of
“garbage in, and garbage out”. It is almost impossible to go big with this aspect of using AI at work as it demands you break down the most mundane aspects of your work and interrogate which parts of them could be carved off as either easily replicable or improved through collaborating with a generative AI tool.
