"AI gives users significant advantages, including greater speed, efficiency, accuracy and situational awareness."

<Files\\Processed x Highly relevant\\2024-06-12 - NZH - AI is ushering in a new era> - § 4 references coded [8.77% Coverage]

Reference 1 - 1.65% Coverage

Given AIâ€™s ability to quickly identify patterns and anomalies in data, it can process vast amounts of transactions than would be possible for humans to review and spot potential fraud with greater speed and accuracy.

Reference 2 - 2.84% Coverage

Later this year, Mastercard will launch its generative AI model that will help banks improve their assessment of transactions. Mastercard says its AI enhancement, which assesses the relationships between multiple entities surrounding a transaction to determine its risk, will boost fraud detection rates on average by 20 per cent and as high as 300 per cent in some instances.

Reference 3 - 2.31% Coverage

The precision of the solution â€" achieved by scanning potential points of sale in real time â€" has been shown in our own analysis to not only increase accuracy, but also reduce the number of false positives by more than 85 per cent,â€ says Mastercardâ€™s president of cyber and intelligence, Ajay Bhalla.

Reference 4 - 1.97% Coverage

Regulatory compliance In such a highly regulated sector, AI is helping to automate regulatory compliance processes and ensure adherence to rules and regulations. AI-powered systems can also help to eliminate manual errors and reduce the risk of non-compliance.

<Files\\Processed x Highly relevant\\2024-06-13 - RNZ - Youre going to have a flying t> - § 1 reference coded [7.03% Coverage]

Reference 1 - 7.03% Coverage

Gavin says the drone uses artificial intelligence (AI) image detection trained on images of various kinds of trees – allowing it to identify wilding conifers all by itself. And it doesn't end there.
"It can then take a GPS location of where that tree is. It can take a photograph of that tree and it can estimate the size of that tree in terms of its height and also its diameter of all of its foliage. After it does its survey flight, all of that information is collated." At this point, the data is checked by a human operator, then the data is passed along to a second, larger drone loaded with herbicide.
"And that drone is then able to go out, following a flight path that has been analysed as being the most efficient flight path, and it's able to go along and spray all those trees, spraying the right amount

of herbicide onto that tree – just enough to kill it."
Gavin says

Kioumars Ghamkhar doesnâ€™t mind a conversation straying into science-fiction, but when it comes to combating weeds without chemicals he has a laser focus â€"much like his invention.
The plant scientist has over the past eight years been developing Map & Zap, an AI-driven laser system that, when attached to a 4WD, tractor or farm robot, identifies weeds before zapping the ones you donâ€™t want into 250 degrees Celsius of oblivion.
T

<Files\\Processed x Highly relevant\\2024-09-18 - WHC - Laser focus on killing farm we> - § 1 reference coded [10.11% Coverage]

Reference 1 - 10.11% Coverage

Ghamkhar, director of the Margot Forde Genebank at AgResearch in Palmerston North, said the AI-driven weed identification and laserzapping technology minimised the need for chemical herbicides.
It could be attached to existing farm machinery and used artificial intelligence (AI) to identify unwanted weeds at the early stages of of their lives. It was then zapped by a 300C laser, killing it to the root.
â€œThink of it like â€˜see and sprayâ€™ technology, but using lasers instead of spray. And, without the off-target damage to surrounding crop or pasture,â€ he said.
Map and Zap software could be programmed to what species it targeted. Trial results had been â€œoverwhelmingly positiveâ€ . It had currently been programmed to identify and zap 16 different species, with the potential to kill more, Ghamkhar said. â€œT

Reference 1 - 3.36% Coverage

Before AI intervened, sifting through retina data to detect the patients who might need further treatment was painstaking, difficult work. Not only does AI speed the testing, which is vital given that the most affected people often struggle to get medical treatment, it is also more accurate than the manual process.
Toku Eyesâ€™ AI picks up things a human might miss. The technology was developed to scan for diabetic retinopathy, but can provide a much broader health check.

<Files\\Processed x Highly relevant\\2025-01-29 - RNZ - Our Changing World- Predator t> - § 2 references coded [9.96% Coverage]

Reference 1 - 3.29% Coverage

To err on the side of caution, Southern Lakes Sanctuary has set the traps to only arm once the inbuilt AI recognises a target species - possums or rodents - to a confidence level of 80 percent.
This is part of an ongoing trial to see whether smart traps could make their conservation mahi more efficient and effective, especially in difficult-to-reach areas.

Reference 2 - 6.67% Coverage

"A big thing for us here... is that we don't have a kea-safe possum trap. So, it's the species we're most trying to protect. In a lot of our areas, the kea do make it a little bit difficult because of their curious intelligent nature," Paul says.
The Kea Conservation Trust has put together a list outlining which traps are safe to use in kea habitats, and which are not. There are not many in the first column: kea can remove screws and nails, roll traps over, set them off with sticks, and rip off the front mesh. But it's not all fun and games: several kea deaths have been reported too.
The basic AT220 is on the 'do not use' list, because recorded kākā deaths in Dunedin and Wellington mean kea are likely vulnerable too.

<Files\\Processed x Highly relevant\\2025-01-30 - RNZ - NZ innovators using artificial> - § 1 reference coded [7.06% Coverage]

Reference 1 - 7.06% Coverage

Dr Helen Blackie, research lead at Critter Solutions, explained their trap used AI to identify species. "If an animal comes up to the trap, it's able to think for itself and decide what animal that is, and if it recognises it as a pest species it triggers the trap, and if it recognises it as being a non-target species or a native species, it's able to make sure it doesn't activate itself."
She said it had allowed them to shift away from designs that tried to deter non-target species by making the traps hard to get into - most animals were much more likely to enter a trap that looked open and inviting, she said.

<Files\\Processed x Highly relevant\\2025-02-12 - RNZ - New uses of artificial intelli> - § 1 reference coded [2.63% Coverage]

Reference 1 - 2.63% Coverage

Another technologist on the AI panel, asked how it could help the "crumbling" public health system, pointed to AI learning within six months to read mammograms more accurately than a radiologist who took 14 years to train.

<Files\\Processed x Highly relevant\\2025-03-02 - TMH - Mindhive to grade leather for> - § 2 references coded [4.84% Coverage]

Reference 1 - 2.17% Coverage

Constant learning enabled Mindhive to use AI and machine vision to grade leather, a role traditionally reserved for people but beset with human error, Bayly said.

Reference 2 - 2.67% Coverage

Mindhiveâ€™s technology claimed an accuracy rate of more than 91% for its gradings, while the current human-driven grading process had an accuracy rate of about 80%, according to its global customers.

<Files\\Processed x Highly relevant\\2025-03-20 - WKT - Good luck getting a job withou> - § 2 references coded [5.58% Coverage]

Reference 1 - 1.95% Coverage

And the use of AI in recruitment could have a beneficial effect in removing human biases. Come from an ethnic minority, or look a bit different? Trained correctly, the employerâ€™s AI tool shouldnâ€™t care about irrelevancies.

Reference 2 - 3.63% Coverage

The risk is then that they might overestimate the likely potential of candidates who had reached senior positions solely through regular job-hopping.
But if there was evidence in firmsâ€™ HR databases that hadnâ€™t tended to work out, for example because of such recruits not staying for long or not doing well enough to earn bonuses, their AI hiring agent might be able to spot that danger and compensate accordingly.
