"If we can use AI that provides links, and we can click on the link and go and see where the information was retrieved from, then we're able to use our own sense of critical thinking to determine if it makes sense and it's from a reputable outfit," says Williamson.

Reference 2 - 9.99% Coverage

Williamson says companies like Google are having a tough time right now because they have to change their whole model of delivering information on the internet. "They've seen a new way of doing it, which is through the use of generative AI.
"But generative AI is incredibly creative, as cats on the moon would suggest, and so they have to contend with moving with the times, and doing so in a trustworthy manner. "And I think that right now not everyone has found the right balance.
"It really shows we can not blindly trust anything particularly that generative AI is producing right now. We have to switch on our brains and be critical thinkers."

The Foundation of Arable Research have quietly deployed the AI tool as Ask FAR on its website. Wondering how to increase grass seed yield? Ask FAR. What about increasing yields, particularly in South Canterbury? You could ask that, too.
The generative AI technology will go through the foundationâ€™s research papers to provide an answer, along with citations, in case users want to take a deeper dive.
â€œHaving the citations was something we were really adamant we needed to have, because weâ€™re a research organisation,â€ FARâ€™s communications manager Anna Heslop said.
It was also important that growers were confident they were receiving verifiable information. FARâ€™s library includes research on crop establishment, nutrition and agrichemical use, soil quality and

greenhouse gas emissions on 40 different crops. While the organisation doesnâ€™t give suggestions, it can list practices that have been most successful, based on the research.
Users can either go and read the research Ask FAR finds, or continue asking questions in a conversation. â€œDifferent growers like different kinds of questions,â€ Heslop said.
It wasnâ€™t not usual for growers to ring up and ask questions and FAR would often direct them to the website, but many said they struggled to navigate it or sift through the large volume of data available, she added.
So when website company Custom D suggested the tool, the foundationâ€™s team was completely on board. â€œItâ€™s happened really quickly,â€ Heslop said. â€œItâ€™s pretty exciting for us to be the first to try it out.â€ Ask FAR was soft launched on August 5.
In its first week, it answered 334 questions, covering topics such as yield improvement, wheat cultivation, weed control and nutrient management.
