Job-hunting in the 21st Century could then become a case of â€˜bots talking to botsâ€™, and if the algorithms hit it off, proposing an interview to both the candidate and employer. That sort of development promises to get rid of a lot of the wasted time and hassle in searching for and applying for new career opportunities, but

Reference 2 - 10.46% Coverage

â€œAI tools can handle screening in a much more efficient way that is a lot more flexible and true to employersâ€™ actual culture,â€ Bian Goh says. And the use of AI in recruitment could have a beneficial effect in removing human biases. Come from an ethnic minority, or look a bit different? Trained correctly, the employerâ€™s AI tool shouldnâ€™t care about irrelevancies.
Instead, AI agents used by employers could help by identifying non-obvious characteristics and quirks in peopleâ€™s personal and work histories that had previously led others to become successful in similar roles.
As an example, Bian Goh agrees that some employers might give too little weight in the hiring process to assessing whether candidates had been promoted in roles by their former employers.
The risk is then that they might overestimate the likely potential of candidates who had reached senior positions solely through regular job-hopping.
But if there was evidence in firmsâ€™ HR databases that hadnâ€™t tended to work out, for example

because of such recruits not staying for long or not doing well enough to earn bonuses, their AI hiring agent might be able to spot that danger and compensate accordingly. Often,
