â€œItâ€™s early days, weâ€™re not seeing it come through yet in remuneration, but thatâ€™s definitely a trend that weâ€™re going to have to think about, and that could be a good thing when it comes to gender pay gaps.
â€œOne of the issues of that is people tend to focus on years of experience, and if women have taken some time out then that can be problematic. But if youâ€™re actually talking about what skills a person needs, then thereâ€™s less of a reliance on the years [worked].â€

Collins said AI tuition could lead to more equitable outcomes.
"So you have your own AI tutor. So instead of having to be wealthy enough to employ a tutor to help the children with the maths or science questions, or something else that the parent doesn't know much about maybe, is to enable that child to have their own (AI) tutor," she said.
"It doesn't do the work for them. It says some things like 'go back, rethink that one, look at that number,' those sorts of things. What an exciting way to do your homework if you're a child."

New Zealand Initiative senior fellow Dr Michael Johnston said many in the education sector hoped the technology would level the playing field, with studies showing students who received one-on-one tutoring performed better (two standard deviations above) those who did not.
"Two standard deviations takes you from the 50th percentile to the 95th percentile, so that's massive. The trouble is, of course, the problem is that we can't afford a one-on-one tutor for every child in school, so if AI can become some proxy for that it could make a substantial difference to education equality."

Chief executive of Sapia.ai, Barb Hyman, told Stuff that chat interviews improve disability inclusion for organisations hiring in high volumes, and remove human bias.
â€œTraditional hiring methods often inadvertently exclude candidates with disabilities... can be stressful and disadvantageous for individuals with social anxiety, hearing impairments, or neurodiverse conditions.â€

"If we know all students have access to appropriate technology and we fund some of those fantastic AI tutors that already exist then we could ensure students not only had the teacher in front of them for support, but they may also have their own personalised AI tutor. That technology already exists," she said.

He said AI is rapidly weaving itself into the very fabric of everyday life and the education sector is no exception.
"Personalised learning platforms powered by AI can adapt to individual learners' needs, pace, and style, offering a tailored educational experience once reserved for elites through practices such as private tutoring.
"This technological shift promises to bridge the gap for learners in under-resourced settings, offering access to quality education worldwide.

He said in New Zealand, it is set up to monitor seismic activity in real-time pretty well, with seismographs, GPS sensors, and infrasound sensors. "Whereas in the Pacific, the volcanoes that we can monitor in real-time, there's only a handful of them, and they are mainly in Vanuatu.
"We have a few new systems set up in Tonga now, but they're still nowhere near as as comprehensive as the monitoring systems we have in New Zealand." Scientists return from Tonga volcano voyage (4 min 48 sec) Cronin said these kinds of tools "help us see things that we might not otherwise see". He said once the AI tool picks something up, they can then bring in a human scientist.
"What we can do is then hone in on things and say, hey, there's something strange there, and then put a pair of human eyes on that, and put in the volcanological expertise.

Reference 2 - 3.24% Coverage

"Anything that we can develop in the terms of AI software, types of approaches that are labour-saving approaches, or kind of prefiltering and pre-screening approaches can be really, really helpful for countries without volcano scientists.

And the use of AI in recruitment could have a beneficial effect in removing human biases. Come from an ethnic minority, or look a bit different? Trained correctly, the employerâ€™s AI tool shouldnâ€™t care about irrelevancies.
Instead, AI agents used by employers could help by identifying non-obvious characteristics and quirks in peopleâ€™s personal and work histories that had previously led others to become successful in similar roles.

A big positive McBride sees for AI is as an enabler of better outcomes and broader access to justice. "Itâ€™s a massive opportunity for people to save money, improve outcomes, and get access to justice where they otherwise couldnâ€™t." Many people face low-value but complex disputes that traditionally wouldnâ€™t justify days of legal advice, he says. "Now AI can untangle the issues, outline options, assess cost and risk, and present it all in a coherent way, within minutes." The

Jackson created KaiBot, a tool designed to help those aged between 5 and 15 learn how to code using tactile, screen-free coding cards (available in Braille and several different languages) to engage neurodiverse learners. The tool runs on a platform called Kaiâ€™s Clan, which integrates robotics,

coding, and interactive problem-solving, and its actions can be mirrored in a virtual playground called Kainundrum.
