Unfaze is getting closer to the production of AI-generated videos that are indistinguishable from manually created content, Singh said. â€œThis is really the Holy Grail of video creation and with the speed at which AI is evolving, we expect to reach this point within a matter of months, not years.â€
Â

<Files\\Processed x Highly relevant\\2024-06-13 - RNZ - Youre going to have a flying t> - § 1 reference coded [6.98% Coverage]

Reference 1 - 6.98% Coverage

Gavin says the drone uses artificial intelligence (AI) image detection trained on images of various kinds of trees – allowing it to identify wilding conifers all by itself. And it doesn't end there.
"It can then take a GPS location of where that tree is. It can take a photograph of that tree and it can estimate the size of that tree in terms of its height and also its diameter of all of its foliage. After it does its survey flight, all of that information is collated." At this point, the data is checked by a human operator, then the data is passed along to a second, larger drone loaded with herbicide.
"And that drone is then able to go out, following a flight path that has been analysed as being the most efficient flight path, and it's able to go along and spray all those trees, spraying the right amount of herbicide onto that tree – just enough to kill it."
Gav

Wongâ€™s research used AI tools to investigate how those groups formed with a focus on hate speech. â€œAs a computational sociolinguist, I study the relationship between language and society. By determining how these digital communities develop, we can also pinpoint the motivators of hateful behaviour.â€
Most moderation and algorithms that detected hate speech online approached the issue as an â€œengineering problemâ€ based on data, Wong said.
Because of this, only certain slurs and swear words were picked up, meaning more culturally nuanced language and offensive online behaviour went unchecked.
People can use techniques like â€œalgospeech,â€ where users talk in a way to evade moderators.
â€œWhat I think a lot of these algorithms and a lot of this research lacks is looking into other forms of hate like inciting violence, inciting exclusion,â€ he said. â€œWe need to look into this more as a social issue.â€ Netsafe chief o

Reference 2 - 7.14% Coverage

An example of this was the anti-transgender and gender diverse rhetoric that came to a head in the past two years, with events such as the Posie Parker tour in New Zealand. â€œA lot of the hate speech that you see is not really slurs, itâ€™s not an insult, itâ€™s more about questioning or not validating peopleâ€™s existence or their identities - thatâ€™s a form of hate speech that should be our focus,â€ he said.
â€œThereâ€™s a lot of good technology out there, thereâ€™s a lot of algorithms and ways of doing things, there's just a bit of a disconnect between the science and the social impact.â€ -----

<Files\\Processed x Highly relevant\\2024-07-29 - TAM - Olympic sprinter Zoe Hobbs> - § 2 references coded [5.27% Coverage]

Reference 1 - 1.26% Coverage

Arti~cial intelligence sports technology, created by Austin, Texas-based VueMotion Labs, could prove

the tool that helps the Kiwi sprinter onto the podium.
Kiwi sprint

Reference 2 - 4.01% Coverage

VueMotion's app captures granular data on Hobbs' running mechanics – step length, frequency, ground contact time, forces, horizontal movement, speed, split times and more. I t generates a visual "kinogram" that her coach can view, instantly seeing areas to improve like foot strike or hip rotation. With this accurate biomechanical data, coaches like Mortimer can understand an athlete's strengths and weaknesses, and use that information to improve the quality of their movement – positively impacting their health and performance.
Us

<Files\\Processed x Highly relevant\\2024-10-20 - WHC - AI models can forecast flu num> - § 1 reference coded [16.17% Coverage]

Reference 1 - 16.17% Coverage

While the health system already uses forecasting models to manage pressure, data scientists have found the very latest AI technology might make a big difference in easing the burden.
The University of Aucklandâ€™s Dr Steffen Albrecht said these machine-learning tools could crunch entire years of variable hospital data at once to reveal useful statistical patterns.
In a just-published study, Albrecht and colleagues found two algorithms in particular â€" each developed for time-series forecasting â€" showed remarkable accuracy at picking admission numbers. One was able to give reliable upper and low bounds of hospitalisation rates weeks ahead of time, while another produced slightly more accurate forecasts, although struggled somewhat with providing reliable confidence intervals.
Albrecht said both models drew on artificial neural networks â€" the basis of AI, including image recognition and large language models like ChatGPT and Metaâ€™s Llama â€" which were likely needed to unravel the complex patterns buried within the surveillance data.

"A big thing for us here... is that we don't have a kea-safe possum trap. So, it's the species we're most trying to protect. In a lot of our areas, the kea do make it a little bit difficult because of their curious intelligent nature," Paul says.
The Kea Conservation Trust has put together a list outlining which traps are safe to use in kea habitats, and which are not. There are not many in the first column: kea can remove screws and nails, roll traps over, set them off with sticks, and rip off the front mesh. But it's not all fun and games: several kea deaths have been reported too.
The basic AT220 is on the 'do not use' list, because recorded kākā deaths in Dunedin and Wellington mean kea are likely vulnerable too.
The team trialled disarmed 'smart' AT220-AI traps in the presence of kea at Kiwi Park in Queenstown. The kea had a great time playing with the traps, which meant the camera and AI had many opportunities to take snapshots. In more than 2000 images, the AI didn't once misidentify the kea as a target species.
In December 2024, the Department of Conservation gave the go-ahead for these smart traps to be used in kea habitat.

Barrett-Young said with Alzheimer's disease and other dementias, they began a long time before any symptoms became apparent, possibly even decades before people noticed cognitive decline.
"Currently Alzheimer's disease and dementia are usually diagnosed based on cognitive tests, including memory tests, things like that.
"But part of the problem is that we all experience some age-related changes in our memory and processing speed over time and that's just completely normal.
"So it takes a while until it's clear that the cognitive decline is beyond a level that is typical of normal ageing and that might suggest that a person has Alzheimer's disease or another type of dementia.
"But that's what makes it really hard to diagnose Alzheimer's disease in the early stages when the damage is only just beginning, and when any interventions we can do, like lifestyle changes, might have the greatest impact." Barrett-Young said the longitudinal study gave the researchers decades of history on each subject. She believed artificial intelligence would play a part in helping to use the retina as a biomarker for determining a person's risk of
dementia.
"What we're able to tell is that there are really small changes in the eye that we probably wouldn't pick up using your standard optometry or ophthalmology tests but that taking those images and being able to use artificial intelligence may be able to give you an idea of a person's risk for dementia.
