Reference 1 - 4.29% Coverage

Police mostly used the AI-driven tech to corroborate existing evidence, place vehicles at times and locations for an investigation, and as supporting evidence in criminal cases, Chen said. A police technologies list described it as a "retail crime intelligence platform".

<Files\\Processed x Highly relevant\\2024-05-21 - NZH - Air NZ taking AI into the skie> - § 1 reference coded [7.69% Coverage]

Reference 1 - 7.69% Coverage

Air New Zealand wonâ€™t make you lick your plate clean but it might note what meal items went untouched during your flight thanks to artificial intelligence (AI).
The airline has revealed it took more than 30,000 photographs of passenger meals in October as part of an AI trial that could help it finesse its menu.
Air New Zealand CEO Greg Foran said he believed the food on the airline was the best heâ€™s ever had but was excited to reveal how the airline used AI to clock what people didnâ€™t enjoy.
â€œWhat weâ€™re now doing is using AI to take photographs of whatâ€™s coming on the galley cart,â€ Foran said, adding that AI was a â€œgame-changerâ€ the company was trialling in several ways.
The

"AI deployment can be used to monitor CCTV footage or, alternately, can be used to monitor prisoner conversations within the facility or via telephone/online communications."

<Files\\Processed x Highly relevant\\2024-06-05 - RNZ - Software for new supermarket b> - § 2 references coded [6.75% Coverage]

Reference 1 - 3.68% Coverage

Two multinational companies with close ties to the New Zealand police have teamed up on anti-crime surveillance inside stores. The new partnership integrates the software system used to recognise

number plates on cars, with bodycams.
It comes as New Zealand supermarkets, in step with overseas trends, are bringing in body-worn cameras to deter rising rates of assaults on staff.

Reference 2 - 3.07% Coverage

CSE said on its website the use of bodycams was spreading from law enforcement into other industries, "taking safety and accountability to the next level".
Foodstuffs said just 16 of its 500 stores across the country used bodycams "to help keep team members and customers safe". Other stores used other measures. Its

Under a half-billion-dollar-plus contract with the Pentagon, Palantir has built what it calls a MetaConstellation, which uses commercial data, including satellite imagery, "to give a near real-time picture of a given battle space". It can also track bushfires or floods.
P

<Files\\Processed x Highly relevant\\2024-08-09 - RNZ - Business to offer AI cameras f> - § 1 reference coded [12.61% Coverage]

Reference 1 - 12.61% Coverage

A US company that puts AI-enabled cameras on the front of buses to try to stop cars from blocking bus stops has entered the New Zealand market.
Hayden AI has teamed up with Japanese owned NEC New Zealand.
Their aim extends to policing bus and cycle lanes, and double-parking, "to improve road safety in New Zealand and Australia", a company statement said.
NEC

<Files\\Processed x Highly relevant\\2024-08-11 - RNZ - The surveilled society- Who is> - § 1 reference coded [18.52% Coverage]

Reference 1 - 18.52% Coverage

Buses - This is the latest. San Fran company Hayden AI that puts car-identifying cameras in bus windshields and has teamed up with big public transport contractor, NEC New Zealand. They are marketing their product to ping drivers crowding bus-stops, bus lanes or cycle lanes, as a road safety tool. Automatic Number Plate Recognition CCTV systems - At least 5000, and possibly up to 10,000 or more, privately owned CCTV cameras nationwide are linked in to two separate privately owned AI-enabled systems for recognising number plates. Police officers tap into this when investigating retail and other crime. Your local council quite likely has some of these. Rollout - since 2015. Airports - Customs is regularly upgrading the facial recognition technology at its e-gates, it checks your face against your passport in less than a blink of an eye - though the biometric data is then held for three months. It has just put out a tender to add a biosecurity function. ANPR on Transmission Gully - The Transport Agency wanted to put ANPR cameras at either end of Transmission Gully motorway near Wellington, to record vehicle travel times in order to see if the road was being run sweetly by its private operator. The question of the plates captures being matched back to the Motor Vehicle Registry remains open - as does whether NZTA will actually go ahead with this, after deferring it at the end of July. Rollout - 2024, but deferred. Billboards - The latest can watch you as you go by and tailor their ads to suit. The country had at least 1400 high-tech billboards last year; it had at least 49 that also have number-plate recognition cameras to count cars (not identify their owners, the operators insist). Some malls have smartscreens that can gauge your mood. Bodycams - Police still do not have these, but prison guards and checkout operators do. Woolworths rolled them out at almost 200 stores in April, with footage downloaded and stored by Singaporean company CSE. Rollout - 2024. Speed-safety cams - The new speed cams going in on highways are powerful enough to see inside your car, and smart enough to send what's wanted back for analysing by AI. Driver on the phone, ping. Not wearing a seatbelt, ping. Waka Kotahi swears this will be used judiciously. Rollout - tests from mid-2023. Congestion charging and tolling - The cameras and new back office tech for these will ensure all that data you generate every day moving about is not lost to the ether, but stored, possibly anonymously, somewhere, possibly in a cloud-computer hypercentre in Sydney or Canberra, for help in generating the next business case.

<Files\\Processed x Highly relevant\\2024-08-20 - RNZ - Autonomous mowers in school fi> - § 1 reference coded [2.47% Coverage]

Reference 1 - 12.47% Coverage

Explaining how it worked, Maclennan said the device used multiple probes.
One located the backbone to make sure the others were properly in the loin while the others collected data. It had to be pulled out slowly and â€œitâ€™s taking thousands of readings as it comes outâ€ , he said. The machine then fed that information into an algorithm to calculate the intramuscular fat content of the meat.
This was used alongside the weight and meat yield measurements to determine the meat grade, before it went off for processing, where grading was previously done during processing. â€œWeâ€™re looking at maximising our number of data points to make a decision,â€ Maclennan said. This ensures consistency: in other words, a customer is more likely to get the same quality of meat every time they buy a certain grade. â€œItâ€™s the same experience every time.â€
The
